AUTHOR: Tkach, V. D. and Ternenko, K. P. Engineers

TITLE: New Machines of the Kiev Factory "Krasnyy Ekskavator"
(Novyye mashiny Kiyevskogo zavoda "Krasnyy Ekskavator".)

PERIODICAL: Mekhanizatsiya Stroitel'stva, 1958,¹⁵ Nr.8. pp. 27 - 30.
(USSR).

ABSTRACT: In 1956 the above factory commenced mass production of small hydraulic excavators with bucket capacity of 0.15 m³ (E-153). The advantages of this excavator are the small size, manoeuvrability and universal application. Table 1 gives figures for various attachments to this crane. Various shortcomings of this excavator were eliminated in collaboration with "Pnevmostroymashina", "Metallorukav", "Kauchuk", Glavekskavator of the Ministry for Building and Road Building Machinery (Ministerstvo stroitel'nogo i dorozhnogo mashinostroyeniya), Glavkhimprom of Ministry for Chemical Industry (Ministerstvo khimicheskoy promyshlennosti) and VNIIStroydormash. The excavator E-153 was adapted for use on the tractor "Belarus" MTZ-5K. The hydraulic cylinders and various other parts were fully standardised to suit excavators E-153, E-221 and ETN-122. This factory also designed and produced a prototype of trench excavator ET-142 which the Tallinn factory put

Card 1/3

SOV/100-59-2-12/13

New Machines of the Kyev Factory "Krasnyy Ekskavator".

into production. After experience gained with excavator E-153, improved excavator E-221 on the base of tractor "Belarus" was produced. Table 2 gives technical data on this excavator. The following leading operatives and engineers of the above factory were concerned with improvements on the construction of excavators: A. M. Luk'yanchenko, A. P. Terekhovskiy, Ya. I. Fefer, V. Yu. Gurban, Yu. I. Mikhaylenko and G. A. Popov. A new design of hydraulic excavator E-156 is being prepared for 1958 based on new pneumatic tractor D-35; Table 3 gives its technical data. The following experimental group were connected with constructions of new machines: T. G. Khomenko, V. P. Rykhlevskiy, G. A. Popov, A. T. Kulyshov and I. P. Bykovtsev. This year the "Krasnyy Ekskavator" will produce over 2,000 excavators E-153, 20 excavators E-221 and 10 trench excavators ETM-122, as well as various new attachments for excavators E-153

Card 2/3

TITLE: The Change in the Structure and the Adsorption Capacities of Aluminum Hydroxide in Dependence on the Conditions of Its Formation

PERIODICAL: Kolloidnyy zhurnal, 1959, Vol XXI, Nr 3, pp 347-350 (USSR)

ABSTRACT: The authors report on a study of the changes of the adsorption capacities of aluminum hydroxide in dependence on a less or more prolonged maturation period of the gel. The experiments revealed that the total of pore volume, and consequently, the adsorption capacities of aluminum hydroxide decrease in proportion to the increase of the ripening period. It results therefrom that during the ripening period (0-45 days) the gel undergoes structural changes, which are characterized by a transition from amorphousness to the crystalline state. X-ray investigation (Debye-Scherrer method)

Card 1/3

The Change in the Structure and the Adsorption Capacities of
Aluminum Hydroxide in Dependence on the Conditions of Its Formation

SOV/69-21-3-19/25

of the same samples fully confirmed the obtained results. The evaluation of the diffraction patterns resulted again in a structural transition of the gel from amorphousness to micro-and macrocrystalline formations. Samples with ripening periods of 2, 10 and 45 days showed a hydrargillite lattice. Heating of the same samples to a temperature of 900°C resulted in a change of the lattice into the structure of corundum. The authors mention the scientist L.I. Shikina, who took part in the adsorption measurements. There are 6 X-ray diffraction patterns, 5 graphs, 3 tables and 19 references, 7 of which are Soviet, 4 German, 4 English and 4 French.

AUTHOR: Vaksleyger, G. A.; Yeremenko, L. F.

TITLE: Changes in respiration and in reflex excitability of the respiratory center during oxygen inspiration

SOURCE: Fiziologicheskiy zhurnal SSSR, v. 50, no. 3, 1964, 280-287

TOPIC TAGS: oxygen effect, oxygen inspiration, respiration frequency, respiration depth, respiratory center reflex excitability, chloral hydrate administration, chlorpromazine administration, cortex activity, motor activity

ABSTRACT: In a series of three experiments on dogs, the effect of oxygen on respiration was investigated under normal conditions, after chloral hydrate administration, and after chlorpromazine administration. Animals were placed in a 175 l closed chamber (ventilated from 45 to 172 l/min) with temperature and air pressure kept at a constant level. Gas composition of air inside the chamber was analyzed periodically with a Holden gas analyzer. Reflex excitability of the respiratory center was determined by electric stimulation of the

Card 1/3

ACCESSION NR: AP4020916

vagus nerve with an ASM-2 unit (80 stimuli/sec; stimulus duration 3 msec). Stimuli were applied from 4 to 10 sec and stimulus threshold was based on minimum coughing effect expressed in milliamperes. After the threshold was established, oxygen was introduced into the chamber and then the chamber was hermetically sealed. Carbon monoxide was absorbed by soda lime. Pneumograms recorded respiratory movements. Findings show that under normal conditions the effect of oxygen on respiration is characterized by two phases. In the first phase (2 to 8 min) respiratory reactions are slightly depressed and in the second phase external respiration is restored to its initial level. Reflex excitability of the respiratory center does not decrease in the first or second phase. With chloral hydrate administration, respiration frequency is reduced and respiration depth is weakened, but they are almost restored to normal after oxygen is introduced. Reflex excitability of the respiration center decreases 1 to 1½ hours after chloral hydrate administration in all cases and remains depressed after oxygen is introduced. With chlorpromazine administration, respiration frequency, depth, and rhythm are slightly depressed. Oxygen helps to restore respiration depth but does not affect respiration frequency.

Card 2/3

ACCESSION NR: AP4020916

With chlorpromazine administration, reflex excitability of the respiration center does not change before or after oxygen is introduced. Both chloryl hydrate and chlorpromazine lower cortex activity and inhibit motor activity, but chlorpromazine differs from other narcotics in that it does not affect reflex excitability of the respiratory center, and this may be of value in certain types of experiments. The normalizing and strengthening direct effect of oxygen on the central nervous system cells is more apparent under conditions of preliminary weakening of cell activity as in the case of chloryl hydrate and chlorpromazine administration. Orig. art. has: 4 figures and 2 tables.

TITLE: Esterification of alcohols with nitric acid. Communication 2. Selective nitration of primary hydroxyl groups in polyhydric alcohols

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 8, 1966, 1436-1440

TOPIC TAGS: mesoerythritol, esterification, ~~nitric acid~~, polyhydric alcohol, nitration, ~~ALCONOL~~

ABSTRACT: The results of an earlier study by the authors have indicated that esterification of polyhydric alcohols with nitric acid of a concentration below 80% yields only primary nitrates. To verify this indication, a study has been made of the esterification of mesoerythritol with excess 79% nitric acid. The esterification product was identified by elemental analysis as erythritol dinitrate. The structure of the product, determined by IR spectroscopy, was identical to that of the product of the oxidation of cis-2-butene-1,4-diol with potassium permanganate. As this product is known to be erythritol 1,4-dinitrate, it was concluded that selective esterification of normal polyhydric alcohols with nitric acid of a concentration below

Protection of Pipeline Reinforcement Against Corrosion Under Conditions
of Tropical Climate

PERIODICAL:

Sb. Kom-ta po korrozii i zashchite metallov Vses. sov. nauchno-tekh.

O-v, 1958, Nr 3, pp 104 - 107

ABSTRACT:

Varnish and paint coatings are recommended for the protection of various products of metal alloys, stainless steel and bronze only for the time of their transportation or for using them at a temperature of $\leq 70 - 90^{\circ}\text{C}$. For the protection of reinforcement grey enamels are recommended: glypthalic enamel Nr 270¹ and perchlorovinyl enamel KHSE-23.² The painting of ferrous metals should be carried out over the V-329 or b-329³ primer, of non-ferrous metals over the FL-03⁴ primer. Puttying is prohibited. For the protection of inner and outer surfaces of the parts galvanic coatings are recommended: cadmium-plating with subsequent chrome-plating; chrome-plating with Ni and Cu sublayer.

Card 1/2

SOV/81-59-9-31732

Protection of Pipeline Reinforcement Against Corrosion Under Conditions of Tropical Climate

and parkerizing. For industrial fasteners and springs the Cr-steels 4Kh13 and 2Kh13 without galvanic coatings are recommended. For the transportation of units and reinforcement the following lubricants should be applied: technical vaseline, the lubricants AMS-1, AMS-3, etc, and also packing paper treated with corrosion inhibitors.

TITLE: Oxygen Flux Cutting of Stainless Steels Using Natural Gas

PERIODICAL: Svarochnoye proizvodstvo, 1959, Nr 10, pp 31-33 (USSR)

ABSTRACT: The authors state that oxygen flux cutting of stainless steels with thicknesses of 10-100 mm and more is used increasingly in different branches of industry. The Taganrog Boiler Factory now uses for oxygen flux cutting the cheap natural gas of the Stavropol' deposits. This gas has a pressure of 0.7 at. at the working site. It contains 97.7% methane, 1.6% nitrogen and 0.7% carbon-gas. The technical characteristics are given in a table. Iron powders of the following types are used: VS, PZhV, VK and PZhE. Table 2 shows the parameters of the welding regime for different thicknesses of steel (10 ÷ 90 mm). For safety at the working site, local ventilation is necessary. In the construction of assembly and ventilation V.I. Kharin and Ye.I. Abramov participated. There are 1 photograph, 4 diagrams and 2 tables.

"The Migration of Oil and Gas and the Classification of Migration Processes,"
Prof I. O. Brod, N. A. Yeremenko, 14 pp

"Vestnik Moskovskogo Universiteta" No 5

The existence of different kinds of oil and gas migration in the earth's crust both through thick series of heterogeneous rocks and through highly permeable beds may be established by taking into consideration the evolution of the ideas of migration and analyzing the principles in the criticism of migration processes in the light of modern data. The existing classifications of migrational processes consider mainly the direction of the movement. A new classification was proposed in 1945-46 by I. O. Brod. This classification in a slightly modified form is given in two tables, where an attempt was made to classify the migrational processes in their mutual relation according to their scale, ways and direction of movement.

from: [unclear], U. S.

I. O. Brod, and N. A. Yeremko, Osnovy geologii nefti i gaza (Principles of the Geology of Oil and Gas), Second Edition, Moscow State University Press, -1953

The authors of the booklet, developing the progressive views of Academician I. M. Gubkin, describe the principal problems of the geology of oil, and outline the circumstances of the accumulation of organic matter in nature, and the conditions of transforming it into combustible products. The authors trace the processes of migration and the conditions of formation of deposits, and generalize on the oil and gas accumulation zones in oil and gas bearing territories.

"The Dispersed Form of the Bindings of Bitumens in the Tertiary Deposits of Northeastern Caucasus"
Trudy Akad. Neft, Prom-sti, No 1, 72-76, 1984

In 1948-1952 almost all the known petroleum-gas manifestations in the Tertiary deposits of northeastern Caucasus were traced down. Luminescent-bituminological analysis was made of 600 specimens from the wells and of 2400 specimens from outcrops. On the basis of the analysis ten types of bitumen were distinguished. The author arrived at a conclusion concerning the essential chemical and genetic kinship of the petroleums and the bituminous substances dispersed in the rocks. (RZh Geol, No 8, 1984)

Title : Chemical composition of oilfield waters as an indicator of the conditions of their formation (as exemplified in the Makhachkala formations)

Periodical : Neft. khoz., v. 33, #10, 52-60, O 1955

Abstract : The author analyses different Makhachkala formations and finds that the chemical composition of oilfield waters (mineral saturation and content, ionization etc.) gives an indication as to the proximity of oil horizons and petroliferous permeable strata. Diagrams, charts, 4 references, 1948-1954.

TITLE: Spectrophotometry of Mars near the opposition of 1956

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 2, 1962, 55,
abstract 2A467 ("Tsirkulyar Astron. observ. Khar'kovsk. un-t",
no. 19, 27-28)

TEXT: Spectrograms were obtained on September 4 and 27, 1956, by means of
a 12^o objective prism on a Mertz refractor ($D = 110$, $F = 550$ mm, dispersion
 $340 \text{ Å/mm at } H\gamma$). Plates FP-4 were used. The α Aql was selected as a comparison
star. Recording diagrams ("registrogram") of the spectra were obtained on a
MF-4 (MF-4) microphtometer. The table gives the values of $\lg I_{\text{Mars}}/I_{\text{Aql}}$ for
382 - 588 μ , corrected for atmospheric attenuation. The graph shows relative
distribution of intensity in the Martian spectrum. The color index, calculated
from observations on September 4, is equal to +1.43 and from observations on
September 27, +1.66. X

PROCESSES AND PROPERTIES INDEX

The physical-chemical properties of cholesterol exposed to ultraviolet radiation. N. P. Veremenko. Arch. sci. biol. (U. S. S. R.) 37, 600-12 (in German 512) (1965). - Cholesterol was irradiated by unfiltered and filtered (360 nm.) ultraviolet light and the phys.-chem. properties of its aq. solns. were studied by Remesov's method (C. A. 60, 3630, 4000). Evidence of a photochem. reaction are adduced, particularly the appearance of a new reaction for oxycholesterol. The latter does not occur with the filtered light. Other phys. and chem. properties of the irradiated cholesterol are widely different from those of ordinary cholesterol and ergosterol. W. A. P.

Title : The Steady State Attained with Repeated Muscular Exercise

Orig pub : Fisiol. zh. SSSR., 1956, 42, No 11, 946-952

Abstract : The steady condition arising in athletes after several repetitions of short-distance sprints, and which is characterized by a stable change in the CO₂ of the alveolar air before and after each run and by constancy in the reserve basicity of the blood, is considered by the author as a certain degree of stabilization of acidosis, in the presence of which athletes usually give a better performance. The level of this steady state depends both upon the distance and upon the running speed. When these are increased the CO₂ content of the alveolar air is reduced.

Card 1/2

Sci Res Inst. Physical Culture, Leningrad

USSR/Human and Animal Physiology - Physiology of Labor and Sports. V-10

Abs Jour : Ref Chur - Biol., No 4, 1958, 16714

Shortening the rest intervals led to a sharp reduction in the level of the steady state. The author suggests judging the correct amount of exertion during training by the CO₂ content of the alveolar air. Lack of stabilization and increasing acidosis are signs of an incorrectly planned session with respect to physical exertion.
